Mona Lisa® 10 (CuT 380A QL)

Intrauterine Contraceptive Device

PHYSICIAN INSTRUCTIONS

Description
The Mona Lisa® 10 (CuT 380A QL) Intrauterine Device (IUD) is made of a T-shaped frame of polyethylene and barium sulphate. The vertical arm is wound with copper wire. There are two additional copper sleeves fixed to the side arms of the Mona Lisa® 10 (CuT 380A QL). The copper surface is 380 mm².

Dimensions: 31.85 mm ± 0.25 mm wide, 35.85 mm ± 0.25 mm long.

The polyethylene frame and the wire are radiopaque.

The following insertion accessories are provided with the IUD:
- hysterometer,
- inserter tube with inserter body,
- inserter rod (plunger).

Mechanism of Action
The Mona Lisa® 10 (CuT 380A QL) is an intrauterine contraceptive device made of polyethylene and barium sulphate. The side arms are flexible and shaped in such a way as to keep the IUD adjacent to the fundus, without stretching the uterine cavity or touching the entrance of the fallopian tubes.

Mona Lisa® 10 (CuT 380A QL) IUD prevents pregnancy by blocking fertilization.

The contraceptive effect is likely due to a pronounced sterile inflammatory reaction, which takes place as a result of a foreign body response in the uterus. The concentration of various types of white blood cells, prostaglandins and enzymes in uterine and tubal fluids increases markedly. These changes interfere with the movement of sperm in the genital tract, reducing their potential fertilizing capacity, so that fertilization is not possible.

In the fallopian tubes, where fertilization is thought to take place, fewer sperm are found in copper IUD users than in non-users. Thus, the primary action is most likely altering the function or survival of sperm and ova before they can meet.

After removal of the Mona Lisa® 10 (CuT 380A QL), fertility is promptly restored to the patient’s normal fertility rate prior to insertion of the device.

Correctly inserted, the Mona Lisa® 10 (CuT 380A QL) IUD is safe for women at low risk of sexually transmitted infection.

Indication
Mona Lisa® 10 (CuT 380A QL) is indicated for:
- Intrauterine contraception in nulliparous and parous women;
- Women who require contraception but have contraindications or sensitivities to estrogen and/or progestin;
- Women who require contraception and are breast feeding;
- Postpartum and post-abortion contraception;
- Emergency contraception.

Mona Lisa® 10 (CuT 380A QL) provides effective contraception for 10 years.

Long-term studies indicate that annual pregnancy rates with the Mona Lisa® 10 (CuT 380A QL) are 0.4 or less per 100 women for 12 years. No pregnancies reported after 8 years.1

The cumulative pregnancy rate up to 10 years of use of the Mona Lisa® 10 (CuT 380A QL) was 2.2 per 100 women-years. The comparative cumulative pregnancy rates after 5, 7 and 9 years were 1.5, 1.7 and 2.1 per 100 women-years.1

Contraindications
Mona Lisa® 10 (CuT 380A QL) is contraindicated in the following situations:
1. Pregnancy or suspicion of pregnancy
2. Past history of ectopic pregnancy
3. Cervical or endometrial cancer
4. Malignant trophoblastic disease
5. Puerperal sepsis
6. Immediate post-septic abortion
7. Acute, subacute and chronic pelvic inflammatory disease (including a history of such an infection within the last 3 months)
8. Presence or suspicion of sexually transmitted infection.
9. Heavy or profuse menstrual bleeding
10. Uterine or cervical malformations (congenital or acquired)
11. Endometriosis
12. Vaginal bleeding of unknown origin
13. Wilson’s disease
14. Known allergy to copper
15. Conditions that can lead to or promote bacteremia (e.g. varicella defects, congenital heart disease)

Warnings and Precautions
The Patient Package Insert must be given to the patient at the time of insertion.

Mona Lisa® 10 (CuT 380A QL) should be used with caution in patients undergoing anticoagulant therapy or suffering from a coagulation disorder.

Before inserting the IUD, a thorough medical history and an examination of the pelvic and abdominal cavity as well as a cervical smear are mandatory. Pregnancy, genital infections or sexually transmitted infections have to be excluded. The position of the uterus and the size of the uterine cavity must be determined to ensure correct insertion of the IUD.

Mona Lisa® 10 (CuT 380A QL) is designed for women with a uterine cavity depth of 6-9 cm.

Post-partum and post-abortion application:
Postpartum women are at a higher risk of expulsion and uterine perforation. For post-partum and post-abortion application, placement may be delayed until complete involution of the uterus that is 6 weeks after an abortion or childbirth, and 12 weeks after a caesarean. Current data suggest that the risk of perforation of the uterus may be increased when insertions are made before normal uterine involution occurs.1

It is recommended that the patient return for a follow-up visit after the first menstruation after insertion. The patient must be re-examined to determine whether the IUD is properly placed and if there are signs of infection. Subsequent follow-up examinations are recommended to be performed annually.

Spotting, light bleeding, heavier or longer periods may occur in the first 3 to 6 months following insertion. These bleeding patterns are not harmful and usually decrease with time. If these events continue or are severe, they should be reported to the physician.

After insertion, the threads should remain outside the cervical canal, in the vagina. After each menstrual period the patient should be instructed to verify with a finger whether the threads of the device can be felt in the vagina. If the patient cannot feel the threads or the patient senses the device, she should contact her physician. If the threads are not visible in front of the cervix at a follow-up examination, they have been drawn up into the cervical canal or uterus and may be attributable to copper allergy.

In a large prospective comparative non-interventional cohort study in IUD users (2010–2012), the risk of pelvic infection (salpingitis), usually requiring removal of the IUD, was 1.4 per 1000 woman-years (95% CI 0.5–1.1; N=41910 insertions).1

Insertion ≤ 36 weeks

For post-partum and post-abortion application, placement may be delayed until complete involution of the uterus that is 6 weeks after an abortion or childbirth, and 12 weeks after a caesarean. Current data suggest that the risk of perforation of the uterus may be increased when insertions are made before normal uterine involution occurs.1

Physician ML10 2015-july/1-3
Perforation

Perforation or penetration of the uterine corpus or cervix by the IUD may occur, most often during insertion. The number of uterine perforations is related to the experience of the person inserting the device. In a large prospective comparative non-interventional cohort study in IUD users (N = 61448 women), the incidence of perforation was 1.3 (95% CI: 1.1 – 1.6) per 1000 insertions in the entire cohort; 1.4 (95% CI: 1.1 – 1.8) per 1000 insertions in the LNG IUS cohort and 1.1 (95% CI: 0.7 – 1.6) per 1000 insertions in the copper IUD cohort.²

The study showed that both breastfeeding at the time of insertion and insertion up to 36 weeks after giving birth were associated with an increased risk of perforation (see Table). These risk factors were independent of the type of IUD inserted.

Table: Incident of perforation per 1000 insertions for the entire study cohort, stratified by Breastfeeding and time since delivery at insertion (parous women)

<table>
<thead>
<tr>
<th>Insertion ≤ 36 weeks after delivery</th>
<th>Breastfeeding at time of insertion</th>
<th>Not breastfeeding at time of insertion</th>
</tr>
</thead>
<tbody>
<tr>
<td>5.6  (95% CI 3.9-7.9; N=6047 insertions)</td>
<td>1.7  (95% CI 0.8-3.1; N=5927 insertions)</td>
<td></td>
</tr>
</tbody>
</table>

The risk of perforation may be increased in women with abnormal uterine anatomy or with fixed retroverted uterus.

In the event of suspected perforation during insertion, remove the IUD immediately. There is a small risk of perforation occurring post-insertion. If perforation is suspected, the device should be located and its removal considered.

Uterine perforation may result in pregnancy. Delayed detection of perforation may lead to IUD migration outside the uterine cavity and/or injury to other adjacent organs.²

Interactions

Published reports have indicated diminished efficacy in the presence of long term use of non-steroidal anti-inflammatory drugs (especially acetylsalicylic acid) and of corticoids. Short term use in the treatment of dysmenorrhea with non-steroidal anti-inflammatory drugs does not appear to reduce contraceptive efficacy.

Do not perforate diaphermy (short wave or microwave) of the sacral or abdominal region since heating of the copper can damage the IUD and may cause heat injury to the surrounding tissue.

Adverse effects

Adverse effects of intrauterine devices, including Mona Lisa® 10 (CuT 380A QL), are low but include the following:

Bleeding:

Menstrual bleeding is sometimes stronger and of longer duration than normal, or is more painful. Iron deficiency anemia may then occur in individual cases. Slight intermenstrual bleeding, often in the form of spotting, may occur but usually subsides spontaneously.

Pelvic Infection:

The risk of pelvic infection (salpingitis), usually requiring removal of the intrauterine device and appropriate antibiotic treatment, may occur and may lead to subsequent infertility. Randomized, controlled studies indicate that any risk of genital tract infection after the first month of IUD use is small. Exposure to sexually transmitted infections (STIs) and not the use of IUD itself, is responsible for PID occurring after the first month of use.

Pain or Dysmenorrhea:

Pain in the lower abdomen or sacral area may occur initially after insertion but usually subsides with time or with analgesic treatment. Pain may be a physiological response to the presence of the device, but the possibility of infection, improper positioning of the device (including perforation and migration), and pregnancy should be excluded. Delayed detection of perforation may lead to IUD migration outside the uterine cavity and/or injury to other adjacent organs, and unintended pregnancy.

Other:

Certain women, in particular nulliparous women, are more susceptible to syncope, bradycardia and other neurovascular episodes during and immediately after insertion or removal of an intrauterine device.

Isolated cases of skin reactions have been described in the literature which may be attributable to copper allergy.

Insertion

Verify that the user is not pregnant. The IUD must not be inserted if there is the possibility of pregnancy.

The best time for insertion is during menstruation to prevent insertion during non-diagnosed pregnancy. At this time the external and internal cervical os are physiologically diluted. This facilitates the insertion of the IUD without the need to dilate the canal in most instances.

When using the Mona Lisa® 10 (CuT 380A QL) for emergency contraception, the IUD may be introduced within 5 days of unprotected coitus. Insertion immediately after unprotected coitus can increase the risk of PID. Mona Lisa® 10 (CuT 380A QL) can also be inserted within 15 minutes of delivery of the placenta or abortion in the first trimester. Note that there is a higher rate of expulsion in these instances.

If the Mona Lisa® 10 (CuT 380A QL) cannot be inserted immediately after delivery of the placenta or abortion, insertion should be delayed for at least six weeks. In case of caesarean section insertion should be delayed for 12 weeks after delivery. Prior to insertion, the vagina, cervix and cervical canal should be cleansed with an antiseptic solution, using e.g. a sterile cotton bud.

It is essential to determine the exact position of the uterus by bimanual pelvic palpation so that the Mona Lisa® 10 (CuT 380A QL) can be inserted along its longitudinal axis. This can be accomplished by grasping the anterior or posterior lip of the cervix, depending on whether the uterus is anteverted or retroverted.

In case of vasovagal reactions after the use of a forceps a local anaesthetic can be injected in and around the cervix.

Step-by-Step IUD insertion instructions

The Mona Lisa® 10 (CuT 380A QL) must be inserted by trained medical staff only.

In order to minimize the risk of contamination, use sterile gloves. Use the enclosed sterile hystometer (sound) to determine the depth and the direction of the uterus. Apply a tenaculum to the cervix and use gentle traction to align the cervical canal with the uterine cavity. Gently insert the hystometer into the cervical canal to measure the depth. Mark the uterus depth on the inserter tube using the sliding blue flange on the insertion tube. The upper end of the sliding flange should correspond with the measured uterus length (see fig. 1).

1. Open the sterile pouch containing the IUD and insertion accessories.
2. While holding the nylon threads straight so as to not disarrange the threads, place the plunger into the insertion body up to the lower end of the IUD stem. Carefully pushing the plunger up to the blue marking on the insertion tube, both sides arms of the IUD slip into the tube. The upper end of the now ready loaded IUD must just 2 mm out of the insertion tube. (fig. 2)

Note:

Due to the soft and flexible insertion tube the side arms may twist inside the insertion tube while being pushed upwards. Adjust the sliding blue flange as described below in Step 3.

The side arms of the Mona Lisa® 10 (CuT 380A QL) must not remain bent for more than five minutes within the insertion tube; otherwise

PHYSICIAN INSTRUCTIONS

Mona Lisa® 10 (CuT 380A QL) is an intrauterine contraceptive device shaped in such a way as to keep the IUD adjacent to the fundus, without stretching the uterine cavity or touching the entrance of the fallopian tubes. The copper surface is designed to release copper ions into the uterine cavity, which affects sperm and egg function.

The pregnancy rates after 5, 7 and 9 years were 1.5, 1.7 and 2.1 per 100 menstrual cycles. The action is most likely altering the function or survival of sperm and ova before normal uterine involution occurs.

The changes interfere with the movement of sperm in the genital tract, reducing the activity of gonadotropins and enzymes in uterine and tubal fluids increases markedly. These events to estrogen and or progestin; however, the IUD may be associated with a lower incidence of estrogen and or progestin.

Mona Lisa® 10 (CuT 380A QL) is indicated for:

- Correctly inserted, the Mona Lisa® 10 (CuT 380A QL) IUD is safe for women aged 18 and older.
- Pregnancy, genital infections or sexually transmitted infections have to be ruled out.
- Women with PRIMA IUDs for 8 or more years.
- Women with a uterus shaped like a heart.
- Pelvic inflammatory disease during IUD use should be treated without delay.
- Women undergoing anticoagulant therapy or suffering from a coagulation disorder.
- Women with a uterus which is not anteverted or posterior lip of the cervix, depending on whether the uterus is anteverted or posterior. In case of vasovagal reactions after the use of a forceps a local anaesthetic may be advisable.
- In case of vasovagal reactions after the use of a forceps a local anaesthetic may be advisable.

Correctly inserted, the Mona Lisa® 10 (CuT 380A QL) IUD is safe for woman for 10 years.

Long-term studies indicate that annual pregnancy rates with the Mona Lisa® 10 (CuT 380A QL) is an intrauterine contraceptive device designed for women with a uterine cavity of the type of IUD inserted. Insertion of the IUD may lead to subsequent infertility. Randomized, controlled studies indicate that the effectiveness of the IUD is increased by about 1% with the use of a vaginal ring.

Mona Lisa® 10 (CuT 380A QL) is an intrauterine contraceptive device designed for women with a uterine cavity of the type of IUD inserted. Insertion of the IUD may lead to subsequent infertility. Randomized, controlled studies indicate that the effectiveness of the IUD is increased by about 1% with the use of a vaginal ring.

Mona Lisa® 10 (CuT 380A QL) must be inserted by trained medical staff after the first menstrual period after delivery or for women undergoing anticoagulant therapy or suffering from a coagulation disorder. It is recommended that the patient return for a follow-up visit after the first menstruation after insertion. The patient must be re-examined to determine if the IUD has been expelled unnoticed. An ultrasound or an x-ray diagnostics should be performed to assess the situation after exclusion of a pregnancy.

Subsequent follow-up examinations are recommended to be performed every 6 months following insertion. These bleeding patterns are not harmful and usually decrease with time. If these events continue or are severe, they should be reported to the physician.

The risk of perforation may be increased in women with abnormal uterine cavity dimensions. Perforation or penetration of the uterine corpus or cervix by the IUD may occur, most often during insertion. The number of uterine perforations is of as biomedical waste.

In the event of suspected perforation during insertion, remove the IUD immediately. In case of a lost IUD or lost parts of an IUD in the uterine cavity either hysteroscopy or ultrasonography or x-rays should be used to determine its location. Curettage may be advisable. In very rare cases of uterine perforation, laparoscopy may be needed.

Packaging

1 x 1 sterile Mona Lisa® 10 (CuT 380A QL) with insertion accessories.

The following insertion accessories are provided with the IUD:
- hysterometer,
- inserter tube with insertions body,
- insertion rod (plunger).

Pharmaceutical information

Each IUD is sterilized with ethylene oxide and is intended for single use only. Do not re-sterilize. Do not use if the pouch is damaged or open since it will not be sterile. Do not insert after the expiry date printed on the sterile pouch. After removal, the Mona Lisa® 10 (CuT 380A QL) should be disposed of as biomedical waste.

Storage

Store in a dry place, between 0 °C and 35 °C. Protect from direct sunlight and moisture.

List of excipients

Copper, Polyethylene, Barium Sulphate, Polylactide 6.

Nature and contents of container

The device (IUD) with accessories has been packed in heat sealed sterilized pouches made of Tyvek + PET/PE.
